APPROVAL PROCESS, THANK YOU**

ROSCOMMON COUNTY SOIL EROSION AND SEDIMENTATION CONTROL (SESC) PROGRAM GUIDE

500 Lake Street
Roscommon, Mi. 48653
Phone (989)275-8323 Fax (989)275-8640

THIS PROGRAM GUIDE HAS BEEN PROVIDED TO ASSIST IN THE APPLICATION FOR A SOIL EROSION AND SEDIMENTATION CONTROL PERMIT. IT IS A GENERAL GUIDENCE DOCUMENT ONLY. COMPLETE PART 91 AND RELATED INFORMATION CAN BE VIEWED AT www.michigan.gov/soilerosion

Michigan Law states that any earth change within 500' of a lake or stream or any earth change of one or more acres in size requires a Soil Erosion and Sedimentation Control (SESC) permit.

SESC Program

The Roscommon County Soil Erosion and Sedimentation Control Program is established under Part 91, Soil Erosion and Sedimentation Control of the Natural Resources and Environmental Protection Act 1994 PA 451, as amended. **Counties are mandated by statute to administer and enforce Part 91.** The program is regulated by a County Resolution with oversight from the Michigan Department of Environmental Quality. The County Enforcing Agency (CEA) is responsible for implementing and enforcing an effective Part 91 program. The SESC permit requires that acceptable SESC measures are used and maintained to effectively reduce accelerated soil erosion and off-site sedimentation.

SESC Permit

Landowners are required to submit a permit application that includes a customer information and signature sheet, a site plan, a project schedule and attachments that, among other requirements, illustrates both the temporary and permanent erosion control measures that they will implement during the earth change project to control erosion and resulting sedimentation. The County Enforcing Agency (CEA) reviews the plan and application then visits the site, and if all criteria are met, issues the permit. The CEA has 30 days to review a complete application and make a decision on the permit. However, the permit is typically issued in 3-10 days depending on completeness of the application.

The site plan and the construction schedule are part of the information required by Part 91 and must be filled out completely and submitted as part of the application. An SESC permit must be extended if a site cannot be stabilized before its permit expires. If a permit is not extended and the site is not permanently stabilized, the coverage will terminate when the permit expires and the site will be in violation of Part 91. Permits can be extended for 12 months. ***Part 91 requires the SESC permit AND site plan to be posted on site until the site is fully stabilized.***

Surety Bond

During the Part 91 permit review process per section 9108 all applications will be evaluated to determine if need exists, as a condition for the issuance of a permit, to require the applicant to deposit with the County Clerk in the form of cash, a certified check, or an irrevocable bank letter of credit, whichever the applicant selects, or a surety bond acceptable to the legislative body of the County in an amount sufficient to assure the installation and completion of such

protective or corrective measures as may be required by the County Enforcing Agency.

Permit Exemption and Waiver for Earthwork Less Than 225 sq. ft. in Size

A “225 square feet waiver” form is available (also considered an Affidavit) for an earth change within 500 feet of a lake or stream. This waiver for a Part 91 permit may be granted after receiving a signed affidavit from the landowner stating that the earth change will disturb less than 225 square feet of earth (*inclusive of all earth disturbance including soil stockpiles, tire ruts, etc.*), and the earth change will not contribute sediment to the waters of the State.

Common Activities Not Requiring an SESC Permit (see part 91 for all others.)

An individual residential property owner may conduct the following activities on their individual residential property owned and occupied by him or her and is not required to obtain a permit under Part 91 if the earth change activities do not result in or contribute to soil erosion or sedimentation of the waters of the State or a discharge of sediment off-site. The property owner although exempt from obtaining a Part 91 permit, is not exempt from the laws and regulations of Part 91. The County Enforcing Agency (CEA) has the right and responsibility to take enforcement action(s) upon any site that results in soil erosion and/or sedimentation leaving the site and/or enters waters of the state. These activities are:

Gardening: all residential gardens, unless the natural elevation is raised. (Raised box gardens where fill dirt would be brought in.)

Stump and Root Removal: if tree and shrub stump removal does not exceed 100 sq. ft.

Post Hole Digging: for fencing, decks, utility posts, mail boxes or a similar application - if no additional grading is done.

An earth change minor in nature that is stabilized within 24 hrs. including but not limited to:

- Plant trees, shrubs, or other similar plants.
- Seed or reseed lawns of less than 1 acre if the seeded area is at least 100 feet from the waters of the State.
- Temporarily stockpile of soil, sand, or gravel not greater than a total of 10 cubic yards on the property if the stockpiling occurs at least 100 ft. from the waters of the State.
- Seawall maintenance that does not exceed 100 square feet.

Other Exemptions:

Farming: plowing or tilling of land for the purpose of crop production or harvesting of crops.(this does NOT include grading or tiling).

Some logging and Mining operations: *some* logging and mining activities are exempt. Access roads to the logging and mining sites and ancillary activities associated with logging and mining operations are not exempt. The removal of clay, gravel, sand, peat or topsoil is not considered “mining” and therefore requires a permit.

Earth changes associated with well locations, surface facilities, flow lines, or access roads related to oil or gas exploration and development regulated under Part 615 of the NREPA

Beach nourishment projects: requires a DEQ permit under part 325 of Act No. 451

Normal road and driveway maintenance: such as grading or leveling, that does not increase the width or length of the road or driveway and that will not contribute sediment to lakes or streams.

Inspections

The County Enforcing Agency (CEA) inspects the site prior to issuing the permit and then inspects the site periodically to ensure compliance throughout the construction phase(s) of the project. A final inspection will be conducted when the project is completed and the site is stabilized. ***The CEA inspects the entire site to ensure, among other things, that ALL SESC measures are installed per plan and functioning, that sediment "dirt" is not being discharged offsite or to waters of the state, that all Part 91 laws and regulations are being followed and the permit is posted.***

Permit Closeout

The owner or contractor should call this office to ask for a final inspection when they believe that all temporary SESC measures have been removed and all permanent measures are in place and the site is stabilized (proper covering of soil that ensures its resistance to soil erosion, sliding, or other earth movement). Rule 1709 of Part 91 states that "disturbed land areas must be stabilized within five calendar days of achieving final grade or the final earth change has been completed".

"On Site" Responsible Party

Even though a contractor or other party is listed on the permit as the "on site" responsible person, it is ultimately the property owners' responsibility that the Part 91 rules are followed. The "on site" responsible person should be someone who will be on the project for its duration. If the onsite person changes during the project it is important to notify the CEA with the name and contact information of the new "on site" responsible person. In order for someone other than the property owner to obtain an SESC permit they must have a letter from the property owner authorizing them as the designated agent.

Violations and Penalties Overview For Not Complying With Permit Conditions or Part 91. The complete Roscommon County SESC Compliance and Enforcement Procedures Document is Available Upon Request.

If violations of Part 91 or a violation of a permit of an approved soil erosion and sedimentation control plan occurs a letter from the CEA will be sent certified, with return receipt requested, to the property owner saying that you are not in compliance and you have 5 days to fix the items listed. If the violations are not corrected, the property owner could be subject to one or all of the following:

- A fine of up to \$25,000 a day.
- Roscommon County may install or maintain the control measures, to bring the site into compliance with Part 91, and bill the landowner for the costs incurred.
- A Cease and Desist Order.
- A person may be ordered to restore all areas affected by the violation.

Projects requiring extra inspections due to the lack of implementation of the approved plans, and maintenance of the SESC controls, may be charged an additional fee of \$50.00 per visit.

Property transfers and the SESC Permit

When a property with an active SESC permit all or in part changes ownership, a "permit transfer" or a "transfer of permit obligations" "notification of Existing Soil Erosion and Sedimentation Control Permit" form needs to be filed with the Roscommon County SESC Program prior to the transfer. The current owner and new owner sign a written agreement transferring the remaining permit obligations, including any current violations, to the new owner. Both forms are available from our office.

Is An SESC Permit Required If I Obtained A Permit From The DEQ For A Land/Water Interface Activity

Yes, if the project involves earth work within 500 feet of a lake or stream or disturbs one or more acres of land. A common example is a seawall that's permitted through the DEQ still requires an SESC Part 91 permit.

Silt Fence

Silt fence is one of the most commonly used controls to remove sediments from construction site water runoff. It is intended to remove sediments by slowing runoff and causing sediments to drop out of suspension as the water passes through the fence. Silt fence is commonly used along the limits of earthwork and around soil stockpiles. Proper installation is important. The flap of the fence must be trenched in or pea stone can be used to anchor the fence flap during frozen ground conditions. Silt fence is not always required if there is a sufficient width of established grass to act as a sediment filter. Silt fence is especially important for projects required to go through the winter in an un-stabilized state (insufficient grass growth). Even well drained soils can experience significant runoff during thaw events when frozen.

Permit Fees For Part 91 Soil Erosion And Sedimentation Control Permits

RESIDENTIAL- EARTHWORK, SINGLE FAMILY	\$140.00
RESIDENTIAL PERMIT EXTENTION - 12 MONTHS	\$50.00
SEAWALL, DRAINFIELD AND WATERWELL-Residential (Required when work is not included on another SESC permit)	\$95.00
COMMERCIAL, INDUSTRIAL PROJECTS	\$300.00
Plan review (non-refundable)	\$100.00
Site Visits-each (# visits to be determined by CEA)	\$50.00
PONDS, SOIL STRIPPING, ONE ACRE	\$150.00
Plan review (non-refundable)	\$50.00
Site Visits-each (to be determined by CEA)	\$50.00
Additional acre - each	\$10.00
SAND AND GRAVEL MINING, per location (4 year permit)	\$250.00

Projects requiring extra inspection due to the lack of implementation of the approved plans, and maintenance of the SESC controls, may be charged an additional fee of \$50.00 per visit.

MAKE CHECKS PAYABLE TO "ROSCOMMON COUNTY"

The application, site plan, construction schedule, letter of authorization, etc., and applicable permit fee can be mailed or delivered to the address below. The applications are received at the Clerks window in the County Building on Lake Street (M-18).

* Designated agent must have a written statement from landowner authorizing him/her to secure a permit in the landowner's name. **YOU MUST USE THE ROSCOMMON COUNTY AUTHORIZATION FORM**

ROSCOMMON COUNTY SESC SITE PLAN SHEET

THE FOLLOWING ITEMS ARE REQUIRED BY PART 91 OF THE NATURAL RESOURCES AND ENVIRONMENTAL PROTECTION ACT PRIOR TO OBTAINING A PERMIT

- CHECK BOX TO INDICATE ITEM IS ON DRAWING OR ON CONSTRUCTION SCHEDULE
- 1) SITE LOCATION SKETCH (SHOWING THE SITE AND IMMEDIATE SURROUNDING ROADS).
- 2) PLAN DRAWING SCALED DOWN TO NO MORE THAN 200 FT PER IN, OR LIST EXACT DISTANCES AND DIMENSIONS
- 3) DISTANCE FROM THE EARTH CHANGES IN FEET TO NEAREST LAKE, STREAM OR OTHER WATER.
- 4) LAND FEATURES (SHOW HILLS, DITCHES, ETC.)
- 5) CONTOUR INTERVALS AND SLOPE DIRECTION WITH ARROWS UNLESS COMPLETELY FLAT.
- 6) FULL PHYSICAL LIMITS OF PROPOSED EARTH WORK / GRADING CHANGES-NOT JUST BUILDINGS**
- 7) SOILS INFORMATION/WRITTEN DESCRIPTION CIRCLE ONE- **SAND CLAY LOAM OTHER** _____
(FOR LARGE PROJECTS A SOILS SURVEY MAY BE REQUIRED)
- 8) A DESCRIPTION AND THE LOCATION OF ALL EXISTING AND PROPOSED DRAINAGE FACILITIES (CULVERTS, ETC.)
- 9) EARTHWORK SCHEDULE. . **WRITE ON THE ATTACHED "CONSTRUCTION SCHEDULE" FORM**
- 10) A DESCRIPTION AND LOCATION FOR INSTALLING AND REMOVING ALL PROPOSED TEMPORARY SESC MEASURES (SILT FENCE, MULCH BLANKET, ETC.)
- 11) A DESCRIPTION AND LOCATION OF ALL PROPOSED PERMANENT SESC MEASURES (SEEDING, RIP RAP, ETC.)
- 12) A WRITTEN MAINTENANCE PROGRAM (WATERING OF SEED, ETC.) INCLUDING PERSON RESPONSIBLE FOR MAINTENANCE. **THERE IS A SPACE ON THE CONSTRUCTION SCHEDULE TO WRITE THIS INFO**

Draw site plan below or attach a separate sheet of paper.

ROSCOMMON COUNTY SESC PROGRAM

Goal

The purpose of the Soil Erosion and Sedimentation Control Program is to serve the public by protecting the waters of the State of Michigan, and to ensure clean water for drinking, swimming, fish and wildlife habitat.

Why is Soil Erosion and Sedimentation Control Important?

Economic Reasons <ul style="list-style-type: none">• Excess sediment can increase the cost of treating drinking water and negatively affect the equipment used in the treatment process.• Sites developed with sound erosion control avoid the costs of removing sediment from storm water structures. Clean sites are also more appealing to potential buyers.	Environmental Reasons <ul style="list-style-type: none">• Sediment in water bodies can cover the eggs of fish and other organisms, preventing them from hatching.• Excess sediment that is suspended in streams and rivers acts like sandpaper on fish and other organisms and can clog their gills, making breathing difficult.• Sediment reduces light penetration, making photosynthesis more difficult for water plants.• Soil particles absorb heat, raising the temperature of the water and driving off desirable fish populations.
Health & Safety Reasons <ul style="list-style-type: none">• Eroded soils enter water bodies and channels, raising water levels and blocking culverts, flooding surrounding land.• Sediment can be deposited onto streets and roads by vehicles leaving the site or by storm water runoff. These sediments can make roadways dangerous.• Soil particles carry pollutants such as pesticides, oil and herbicides, that enter water bodies along with the soil, creating unhealthy conditions for wading and swimming, and affecting water quality.	Aesthetic & Recreational Reasons <ul style="list-style-type: none">• Clear water is more desirable for swimming, boating, canoeing and fishing than muddy water.• Excess sediment builds up in lakes and rivers. This raises the water level but reduces water depth, which decreases canoeing and fishing opportunities.

Soil Erosion Control Requirements

- Earth moving activity can not begin without a Soil Erosion Permit. The Soil Erosion Permit must be posted and be clearly visible from the road.
- Soil erosion and sedimentation control measures as designated on plans and/or as required must be installed prior to any earth moving activities.
- Earth changes to a property must not adversely affect drainage to surrounding areas.
- Detention/retention/sedimentation ponds must be constructed and stabilized prior to other earth moving activities.
- Outlets of detention/retention/sedimentation ponds shall be designed and constructed to reduce the water flow to a non-erosive velocity. Rip-rap must be installed on all storm water outlets.
- All earth moving shall be designed, constructed and completed in such a manner that limits the exposed area of any disturbed land for the shortest possible period of time. The site must be stabilized within 5 calendar days after final grading or earth moving activity has been completed.
- Stone access drives, if required, must be installed prior to construction for purposes of mud tracking.
- Soil, sediment, and miscellaneous debris must be kept off streets and out of drainage ditches and catch basins throughout the duration of the project.
- Silt fencing, if required, must be trenched in and backfilled. Fencing may be toed-in with pea gravel if installed in winter.
- Stockpiling of any excavated material must be kept clear of sensitive areas. Adequate controls must be in place to ensure this requirement.
- Erosion control blankets are required on slopes of 4:1 or steeper.
- All permanent erosion control measures shall be permanently maintained by the owner or homeowner association.

Soil Erosion and Sedimentation Control Measures (Examples of)

CATCH BASIN FILTER Geotextile filter fabric placed inside a catch basin (storm drain) to filter suspended sediment from water. Must have regular maintenance after storm or snow melt events to function properly.

CHECK DAM Temporary measure consisting of a line of 4-8" stone piled a maximum of 2 ft. high that slows the flow of water in ditches, swales or natural drainage areas. Check dams should be built so that the center of the wall is lower than the outside edges, and should be spaced so that the top of the downslope check dam is level with the bottom of the upslope check dam.

ROSCOMMON COUNTY SESC PROGRAM

DETENTION/RETENTION BASIN Drainage basins or ponds designed to hold and filter water draining from developed site so as to prevent flooding and filter suspended sediment from water. Required for most major projects.

EROSION CONTROL BLANKET A blanket composed of a mesh of biodegradable material, usually interfaced with straw mulch, and sometimes containing grass seed, used for controlling erosion on steep downslopes. Erosion Control Blankets must be staked in, trenched in at the top and flat against the ground.

RIP-RAP Rock-type material (usually 6-8' stone) placed on the edges of culverts or drainage outlets to slow water to a non-erosive velocity, preventing erosion. Stone should be arranged in a half-circle around the end of the outlet.

SILT FENCING Temporary measure consisting of wooden fence posts, support system, and a geotextile filter fabric (usually nylon) used to keep suspended soil particles from leaving the site. Required to be trenched in to a depth of 6".

VEGETATIVE BUFFER A strip or area of vegetation used to filter sediment and pollutants from runoff. The minimum width for a filter strip is usually 25'.

Methods of Acceptable Stabilization of Disturbed Soils

The best way to avoid soil erosion is to disturb the least possible amount of soil during grading and construction. If erosion control measures are not functioning properly, causing erosion to occur on the site, the site will not be considered stabilized.

MAINTENANCE IS THE KEY TO PROPER SOIL EROSION CONTROL!

Temporary Stabilization - Below is a list of some temporary stabilization measures, but other temporary stabilization methods may be used, if appropriate or needed

- 1) **Mulch** - This typically is in the form of straw, spread heavily over a disturbed area to protect the exposed soil from rain and wind erosion. For proper stabilization, the soil must not be visible through the mulch. Mulch should be used:
In flat areas with a low amount of water runoff, and/or in areas with adequate protection from high winds

High velocities of run-off will wash away mulch on moderate to steep slopes. High winds can also carry mulch away. Spreading seed prior to mulching greatly aids in the permanent stabilization of the site.

- 2) **Erosion Blankets** - Consist of straw, coconut fiber or excelsior fiber packed in web netting. Erosion control blankets are suitable for moderate slopes and steep slopes on sites with soil that is susceptible to erosion. The blankets are laid at right angles over a disturbed area, staked in place, and toed in at the top of the slope, with a **6-inch overlap** of all edges. Blankets are also available with seed in them to enhance permanent stabilization of the slope. If rills (narrow-bands) and gullies (wide-bands) are eroding underneath the blankets, the soil will not be considered stabilized.
- 3) **Hydro Seed** - Hydro seed may be used as temporary stabilization on relatively flat areas with low volume of runoff. Hydro seed can wash away easily in heavy rains. It is recommended that hydro seed with a high content of mulch be used to provide a better barrier between the weather and the soil. If cared for properly, hydro seed will grow, stabilize the site, and provide permanent stabilization.
- 4) **Tarps** - These are plastic sheets used to cover stockpiles or small disturbances. They may not be used for large disturbances.

Permanent Stabilization -

Below is a list of some temporary stabilization measures, but other temporary stabilization methods may be used, if appropriate or needed.

- 1) **Established Vegetative Cover** - Any form of vegetation that provides a root base in the soil and a barrier between the soil and the weather can be considered permanent stabilization. Forms of acceptable vegetative cover when properly installed and maintained are sod, grass, native trees, shrubs and ground cover.
- 2) **Woodchips** - As part of landscaping a thick layer of wood chips or other "permanent" mulch is acceptable in non-sloped areas.
- 3) **Stone** - A thick layer of stone is considered permanent stabilization on all areas except steep slopes. This includes gravel drives, stone gardens, and pavers used for foot traffic. Geotextile fabric placed underneath stone in swales and drives is advisable.
- 4) **Pavement** - Roads or driveways are considered permanent stabilization.

It is important to remember that none of the above methods guarantee stabilization. Proper maintenance is the key to good stabilization.
